Task 1: List regex that extracts dates from <http://bit.ly/regexexercise2> and formats them as YYYY-MM-DD?

URL for the solution:

<https://regex101.com/r/Lby59n/1>

Brief explanation:

The regular expression we put in is: `\b\d{1,2}.\d{1,2}.\d{4}\b`

- `b\` means in the beginning of the word
- `\d` matches a digit equivalent to `[0-9]`
- `\d{1,2}` means that the days either contains 1 or 2 digits
- `.` is a metacharacter and it matches any character, so `-` and `.` in our case
- `(space)?` matches the previous token between 0 or 1 times, as many times as possible, given back as needed.
- `\d{1,2}` means that the months contains either 1 or 2 digits
- `.` is a metacharacter and it matches any character, so `-` and `.` in our case
- `(space)?` matches the previous token between 0 or 1 times, as many times as possible, given back as needed.
- `\d{4}` means that the year contains 4 digits
- `\b` means the end of the word

We get 30 matches of dates

Task 2 Regex to convert stopwordslist between R and Voyant format

R to Voyant:

<https://regex101.com/r/MvNTRR/1>

Brief explanation:

We put in the Regular Expression: `([a-z0-9æøå]+)(\n)`

- `[a-z0-9æøå]` matches all the characters present in the plotted test string.
- `+` matches the previous token between one and unlimited times.
- `\n` matches the line break

In "Substitution" we then plot in "\$1", referring to the first group in the regular expression à which creates the neat stopwords list for R, where the words are separated by commas.

Voyant to R

<https://regex101.com/r/zGeqCC/1>

Brief explanation:

We then do it the other way around and plot in <http://bit.ly/regexexercise4> in the test string in R and write `"", "` as the regular expression, which matches the characters `"", "` literally. We then in "Substitution" put in `\n` which converts into a new line between all the `"", "` in the test string.

Task 3 Does OpenRefine alter the raw data during sorting and filtering?

YES / NO

Yes OpenRefine alter the raw data during sorting and filtering

Task 4: What are the two most water-deprived months in Mozambique and Tanzania?

The most water deprived months in Mozambique and Tanzania is September and October

Task 5: Challenge - 10 most common occupations among unmarried women 20-29 years old in [1801 Aarhus](#)

- Total number of people in your selected cohort:

The total number of people in our cohort is 2146, which means that there are 2146 unmarried women in the age 20-29 in 1801 in Aarhus.

2,146 matching rows (44,559 total)

- Define what is / is not an occupation:

We have defined occupation as women who do not live on charity but instead earn their living through a precise occupation listed as their main occupation.

So we defined that for example “lever af sine midler”, “Amme”, “Dum og døv”, “Vanfør og tåbelig”, “Vanvittig og almisselem”, “ligger ved sengen og underholder sig af sin bror” is not occupations.

10 most frequent occupations (list number of people practising that job with each entry)

We have clustered as much as possible until we got this list of the 10 most frequent occupations. “Tjenestepige” is the most frequent occupation for unmarried women in the age 20-29. Then comes “væverske” which there are 13 of in our cohort. Thirdly comes the 10 “husjomfru” which has a higher hierarchy position than the “husholderske” whom there are 7 of. They share a fourth and fifth place with the also 7 “inderste og væverpige”. Then we could not figure out how to cluster the 6 who is “lever af sine midler” but we don’t define this as an occupation. So the 6th most frequent occupation is “ernærer sig af syning”. The same amount of women “tjener faderen” and “tjener forældrene”. Number 9 of most frequent is “væverpige” and the 10th is “bryggerpige” which four women in our cohort is.
